

Migraine Aura Report

Provided by the Migraine Aura Foundation

Result: Your responses suggest you may be experiencing migraine aura.

Summary

Based on your answers, your symptoms are consistent with **migraine aura**, a neurological phenomenon that often precedes or accompanies migraine headaches.

This type of migraine is historically referred to as:

Classic migraine, ophthalmic migraine, hemiparaesthetic migraine, hemiplegic migraine, aphasic migraine, migraine accompagnée, or complicated migraine.

Diagnostic Threshold Reached

Your responses indicate that the ICHD-3 criteria for migraine with aura have likely been met.

This means that a sufficient number of typical features—such as gradual onset, full reversibility, limited duration, and association with headache—were present to suggest a pattern consistent with migraine aura.

These criteria help differentiate migraine aura from other possible neurological conditions.

Important Disclaimer

This tool **does not provide a medical diagnosis**. It is intended for **informational purposes only**.

Neurological symptoms can have many causes—some of them serious. This tool assumes your symptoms are **not better explained by another condition**, such as **stroke, epilepsy, multiple sclerosis**, or a known **eye disorder**.

 If your symptoms are **new, unusual, worsening, or accompanied by other health concerns**, **seek medical advice immediately**.
